

Enterprise engineering studio · Intelligent software for modern commerce

Intelligent systems built to quietly run commerce.

Sanad constructs operational backbones and bespoke autonomous logic for commercial enterprises. We remove the cognitive and administrative weight of scaling — engineering a structural reduction of at least 30% in daily operational load.

Request Technical Dossier →

Read the 30% baseline

For Leadership

Predictable velocity, margin protection, and operational clarity.

For Engineering

Decoupled architecture, local-first integrity, and zero black-box dependencies.

01 Proof by metric

The 30% efficiency baseline

Operational load is not a feeling. It is waiting, re-keying and reconciling — three things that can be measured, and removed. Every system we build is specified against one baseline: a structural reduction of at least 30% in daily operational load.

01 Inventory & Supply Sync

Before

18 hours

of multi-channel lag between stock and sales

With Sanad

Sub-second

synchronization across every channel

02 Financial & Reconciled Auditing

Before

Repeated

reconciliations, performed by staff each cycle

With Sanad

Zero-loss

balancing routines, automated end to end

03 Human Error Overhead

Before

Re-keyed

data entered again in each system it touches

With Sanad

Eliminated

structurally: one entry, one record of truth

≥ 30%

of daily operational load, structurally removed.

Daily operational load, indexed to a baseline of 100

02 Systems & architecture

Ready-made modules. Bespoke engineering.

Two explicit offerings, never blended. Pillar A is production-tested software, configured for your business. Pillar B is engineered from scratch, for operational flows that belong to you alone.

Pre-configured SaaS · Pillar A

Turnkey Intelligent Modules

High-efficiency, production-tested systems, ready for deployment.

Select a module. Follow the data.

Inventory

Units

Ledger

Owns

Stock position per node, reservations and transfers.

One stock position across every warehouse, store and channel.

Schema

```
type StockLevel {
  sku      string
  node     NodeId // warehouse
  or
  on_hand  int
  reserved int // held for open orders
  version  timestamp // deterministic ordering
}
```

Parameters

Topology

n-node, multi-warehouse

Sync

event-sourced, deterministic merge

Reservations

per-channel holds, auto-expiry

Offline

node-local ledger, reconcile on reconnect

Latency

< 100 ms in-site, sub-second across channels

A.1 · Interface wireframe

Inventory & Distributed Warehousing Logic

A.2 · Interface wireframe

Hospitality & Unit Management Engines

A.3 · Interface wireframe

Unified Commerce & POS Ledger Sync

03 System mechanics & technical rigor

Specified like infrastructure, stated so it can be tested.

For CTOs and technical evaluators

Data ownership

Sovereign

Complete sovereignty. Databases synchronize with client-controlled infrastructure.

Reliability

Offline-capable

Operational nodes designed to function without internet disruption.

Latency

< 100 ms

Sub-100ms internal state changes across multi-terminal setups.

Integrations

Deterministic

Clean, deterministic APIs connecting legacy ERPs, payment gateways, and third-party logistics.

04 Security & compliance

Stated plainly, so it can be checked.

Properties of the systems we build, written as specifications rather than assurances.

We do not claim certifications on this page. If you must meet a specific regulation, we design to it and show you how.

- ✓ **Data location**
Client-controlled infrastructure.
- ✓ **Access**
Role-based. Permissions are explicit and reviewable.
- ✓ **History**
An append-only record of changes and actions.
- ✓ **Agents**
Bounded permissions, approval gates, a full action log, and every action reversible.
- ✓ **Network**
Outbound access denied by default.
- ✓ **Failure**
Offline-capable nodes and deterministic recovery.

05 How we work

Four stages. One owner at each.

Every engagement follows the same order, so you always know what is being decided and what comes next.

01 Understand

We map how work actually moves through your business: systems, hand-offs, waiting and re-entry.

You receive

A written map of current operations, and the baseline for the 30% target.

02 Design

We specify the system: data model, integrations, failure behavior, and what must run offline.

You receive

An architecture document you can hand to your own engineers.

03 Build

We build and test in your environment, in stages, each one usable on its own.

You receive

Working software, tested against the baseline.

04 Operate

We run it with you, monitor it, and hand over ownership when you are ready.

You receive

Runbooks, access, and the option to run it yourselves.

06 Engagement models

Two ways to start.

Best when

Turnkey modules

Your process matches a standard shape: stock, units, a sales ledger.

Bespoke systems

Your operations are particular to you and no product fits.

What we do

Turnkey modules

Configure, connect and deploy a tested module.

Bespoke systems

Specify and engineer from scratch.

From you

Turnkey modules

Access to current systems, a named process owner, and your configuration decisions.

Bespoke systems

Time with the people who run the work, access to systems and data, and a named decision-maker.

You get

Turnkey modules

A running system, and training.

Bespoke systems

A system built to your flow, with full documentation.

Start with

Turnkey modules

The technical dossier.

Bespoke systems

An architectural walkthrough.

07 Questions from engineers

Plain answers to the usual questions.

Longer answers, with diagrams, are in the technical dossier.

Ask us directly →

Who owns the data?

You do. Databases synchronize with infrastructure you control, and we keep no copy that we depend on.

What happens without internet?

How do we migrate from our current system?

Can it connect to our ERP and payment gateway?

Do agents send our data to outside services?

What if we outgrow a turnkey module?

08

The Sanad manifesto

Software should clarify the mind, not demand it.

Most enterprise software creates its own bureaucracy. Teams spend hours managing the tool that was supposed to save them time.

Sanad is built on the inverse thesis: intelligent software works silently in the background so leaders and builders can dedicate their focus to what actually matters.

Support for the people who lead.

If the work is heavier than it should be, we should talk.
