

Enterprise engineering studio · Intelligent software for modern commerce

Intelligent systems built to quietly run commerce.

Sanad constructs operational backbones and bespoke autonomous logic for commercial enterprises. We remove the cognitive and administrative weight of scaling — engineering a structural reduction of at least 30% in daily operational load.

Request Technical Dossier →

Read the 30% baseline

For Leadership

Predictable velocity, margin protection, and operational clarity.

For Engineering

Decoupled architecture, local-first integrity, and zero black-box dependencies.

The 30% efficiency baseline

Eighteen hours of lag becomes **sub-second**. Repeated reconciliations become **zero-loss**. Data re-keyed in every system is **eliminated**.

01 Proof by metric

≥ 30%

of daily operational load, structurally removed.

Every system we build is specified against one baseline: a structural reduction of at least 30% in daily operational load.

02 Systems & architecture

Ready-made modules. Bespoke engineering.

Two explicit offerings, never blended. Pillar A is production-tested software, configured for your business. Pillar B is engineered from scratch, for operational flows that belong to you alone.

Pre-configured SaaS · Pillar A

A

Turnkey Intelligent Modules

High-efficiency, production-tested systems, ready for deployment.

Select a module. Follow the data.

Inventory Units Ledger

Owms

Stock position per node, reservations and transfers.

One stock position across every warehouse, store and channel.

Schema

```
type StockLevel {
  sku      string
  node     NodeId // warehouse
  or store
  on_hand  int
  reserved int // held for open orders
  version  lamport // deterministic ordering
}
```

Parameters

Topology	n-node, multi-warehouse
Sync	event-sourced, deterministic merge
Reservations	per-channel holds, auto-expiry
Offline	node-local ledger, reconcile on reconnect
Latency	< 100 ms in-site, sub-second across channels

A.1 · Interface wireframe

Inventory & Distributed Warehousing Logic

06

Engagement models

Two ways to start.

Best when

Turnkey modules

Your process matches a standard shape: stock, units, a sales pipeline.

Bespoke systems

Your operations are particularly complex and no product fits.

What we do

Turnkey modules

Configure, connect and deploy a module.

A.2 · Interface wireframe

Hospitality & Unit Management Engines

Units	Housekeeping	This week
101	Mon Tue Wed Thu Fri Sat Sun	
102		
103		
201		
202		

● Occupied ● Turnover □ Blocked no overLaps

A.3 · Interface wireframe

Unified Commerce & POS Ledger Sync

Who owns the data?

You do. Databases synchronize infrastructure you control, and copy that we depend on.

What happens without internet?

How do we migrate from current system?

Can it connect to our ERP payment gateway?

Do agents send our data outside services?

What if we outgrow a tu module?

Bespoke systems · Pillar B

Tailored Commercial Architecture

From-scratch systems, engineered for unique, proprietary operational flows.

B.1

Custom internal operating systems

Replacing patchwork spreadsheets

One system of record in place of a folder of spreadsheets: role-based views, enforced workflows, and a history of every change.

record single source of truth

access role-based

history append-only

B.2

Private agentic workflows

Operating securely on client infrastructure

Autonomous logic that runs inside your perimeter, on your hardware or your cloud account. Every action is logged, bounded by explicit permissions, and reversible.

runtime client infrastructure

egress denied by default

oversight approval gates, full action log

B.3

High-availability distributed databases

With offline-first synchronization

Replicated stores that keep accepting writes when the network does not, then converge deterministically when it returns.

writes local-first

merge deterministic

single point of failure none, by design

03 System mechanics & technical rigor

Specified like infrastructure, stated so it can be tested.

For CTOs and technical evaluators

Data ownership

Sovereign

Complete sovereignty. Databases synchronize with client-controlled infrastructure.

Reliability

Offline-capable

Operational nodes designed to function without internet disruption.

Latency

< 100 ms

Sub-100ms internal state changes across multi-terminal setups.

Integrations

Deterministic

Clean, deterministic APIs connecting legacy ERPs, payment gateways, and third-party logistics.

04 Security & compliance

Stated plainly, so it can be checked.

Properties of the systems we build, written as specifications rather than assurances.

We do not claim certifications on this page. If you must meet a specific regulation, we design to it and show you how.

✓ Data location

Client-controlled infrastructure.

✓ Access

Role-based. Permissions are explicit and reviewable.

✓ History

An append-only record of changes and actions.

✓ Agents

Bounded permissions, approval gates, a full action log, and every action reversible.

✓ Network

Outbound access denied by default.

✓ Failure

Offline-capable nodes and deterministic recovery.

05 How we work

Four stages. One owner at each.

Every engagement follows the same order, so you always know what is being decided and what comes next.

01 Understand

We map how work actually moves through your business: systems, hand-offs, waiting and re-entry.

You receive

A written map of current operations, and the baseline for the 30% target.

02 Design

We specify the system: data model, integrations, failure behavior, and what must run offline.

You receive

An architecture document you can hand to your own engineers.

03 Build

We build and test in your environment, in stages, each one usable on its own.

You receive

Working software, tested against the baseline.

04 Operate

We run it with you, monitor it, and hand over ownership when you are ready.

You receive

Runbooks, access, and the option to run it yourselves.

06 Engagement models

Two ways to start.

Best when

Turnkey modules
Your process matches a standard shape: stock, units, a sales ledger.

Bespoke systems
Your operations are particular to you and no product fits.

What we do

Turnkey modules
Configure, connect and deploy a tested module.

Bespoke systems
Specify and engineer from scratch.

From you

Turnkey modules
Access to current systems, a named process owner, and your configuration decisions.

Bespoke systems
Time with the people who run the work, access to systems and data, and a named decision-maker.

You get

Turnkey modules
A running system, and training.

Bespoke systems
A system built to your flow, with full documentation.

Start with

Turnkey modules
The technical dossier.

Bespoke systems
An architectural walkthrough.

07 Questions from engineers

Plain answers to the usual questions.

Longer answers, with diagrams, are in the technical dossier.

Ask us directly →

Who owns the data?

You do. Databases synchronize with infrastructure you control, and we keep no copy that we depend on.

What happens without internet?

How do we migrate from our current system?

Can it connect to our ERP and payment gateway?

Do agents send our data to outside services?

What if we outgrow a turnkey module?

08

The Sanad manifesto

Software should clarify the mind, not demand it.

Most enterprise software creates its own bureaucracy. Teams spend hours managing the tool that was supposed to save them time. Sanad is built on the inverse thesis: intelligent software works silently in the background so leaders and builders can dedicate their focus to what actually matters.

Support for the people who lead.

If the work is heavier than it should be, we should talk.
