```
data.location      = client-controlled
access             = role-based, explicit, reviewable
history            = append-only
agents             = bounded · approval-gated · logged · reversible
network.egress     = deny
failure            = offline-capable · deterministic recovery
```

We do not claim certifications on this page. If you must meet a specific regulation, we design to it and show you how.

Stated plainly, so it can be checked.

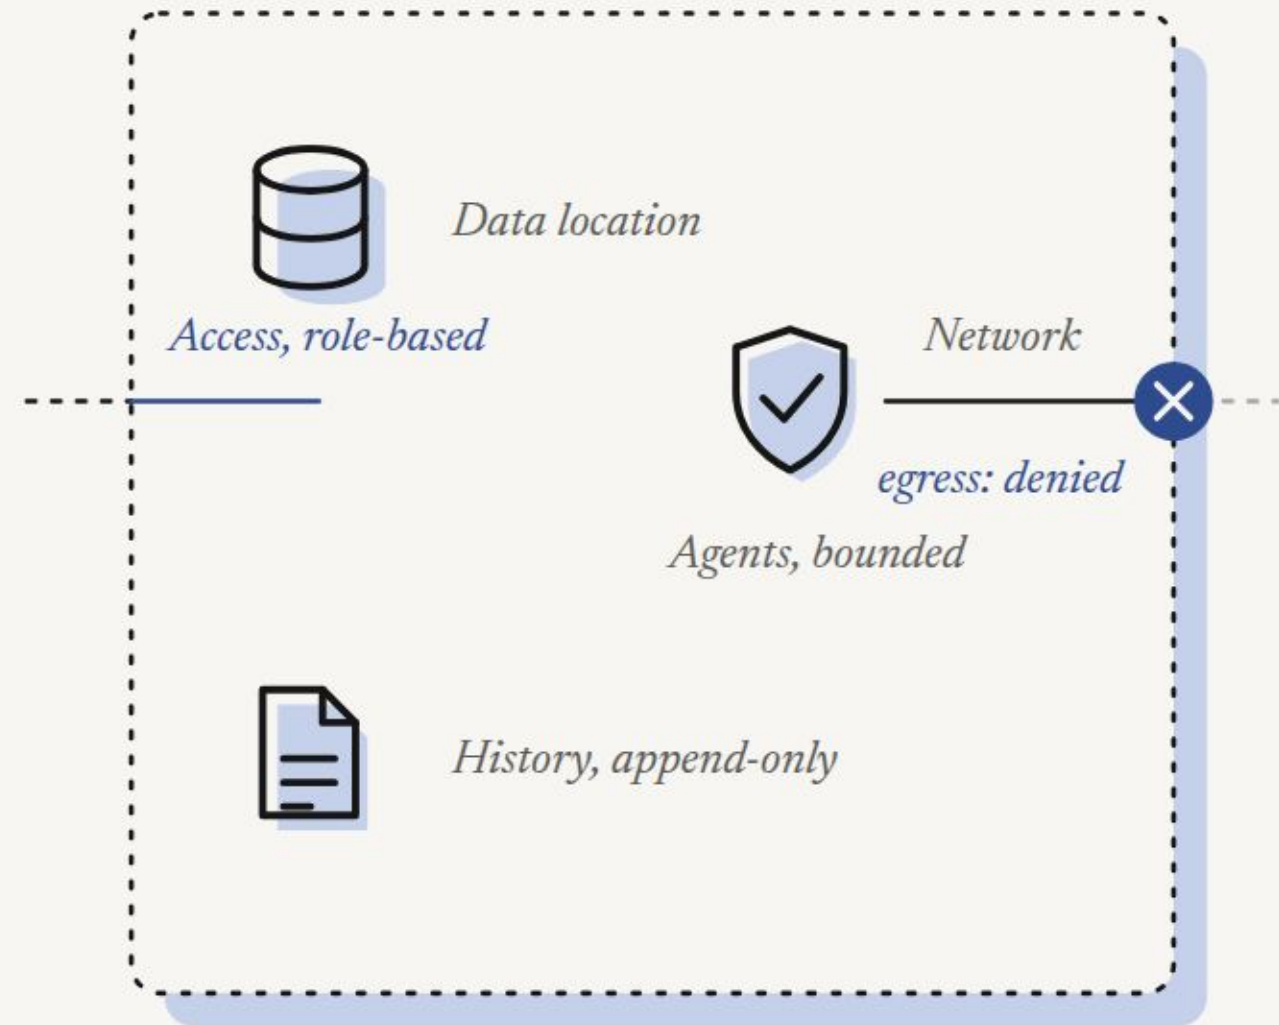

Your data lives on
client-controlled infrastructure. Access is
role-based, and every change is
recorded, append-only. Agents run
bounded and reversible, the network is
closed by default, and when something fails,
it recovers deterministically.

We do not claim certifications on this page. If you must meet a specific regulation, we design to it and show you how.

Data location *Client-controlled infrastructure.*

Access *Role-based. Permissions are explicit and reviewable.*

History *An append-only record of changes and actions.*

Agents *Bounded permissions, approval gates, a full action log, and every action reversible.*

Network *Outbound access denied by default.*

Failure *Offline-capable nodes and deterministic recovery.*

We do not claim certifications on this page. If you must meet a specific regulation, we design to it and show you how.
