

Enterprise engineering studio • Intelligent software for modern commerce

Intelligent systems built to quietly run commerce.

Sanad constructs operational backbones and bespoke autonomous logic for commercial enterprises. We remove the cognitive and administrative weight of scaling — engineering a structural reduction of at least 30% in daily operational load.

Request Technical Dossier →

Read the 30% baseline

For Leadership

Predictable velocity, margin protection, and operational clarity.

For Engineering

Decoupled architecture, local-first integrity, and zero black-box dependencies.

The 30% efficiency baseline

Eighteen hours of lag becomes **sub-second**. Repeated reconciliations become **zero-loss**. Data re-keyed in every system is **eliminated**.

01 Proof by metric

≥ 30%

of daily operational load, structurally removed.

Every system we build is specified against one baseline: a structural reduction of at least 30% in daily operational load.

02 Systems & architecture

Ready-made modules. Bespoke engineering.

Two explicit offerings, never blended. Pillar A is production-tested software, configured for your business. Pillar B is engineered from scratch, for operational flows that belong to you alone.

A Turnkey Intelligent Modules

Choose what you run.

Request this configuration →

☒  Inventory	☐  Units	☒  Ledger
Stock position per node, reservations and transfers.	Units, stays, availability and turnover tasks.	The transaction ledger: every entry, posted once.
One stock position.	No two stays overlap.	Debit equals credit.

Bespoke systems • Pillar B Tailored Commercial Architecture		
From-scratch systems, engineered for unique, proprietary operational flows.		
B.1  Custom internal operating systems Replacing patchwork spreadsheets One system of record in place of a folder of spreadsheets: role-based views, enforced workflows, and a history of every change. record single source of truth access role-based history append-only	B.2  Private agentic workflows Operating securely on client infrastructure Autonomous logic that runs inside your perimeter, on your hardware or your cloud account. Every action is logged, bounded by explicit permissions, and reversible. runtime client infrastructure egress denied by default oversight approval gates, full action log	B.3  High-availability distributed databases With offline-first synchronization Replicated stores that keep accepting writes when the network does not, then converge deterministically when it returns. writes local-first merge deterministic single point of failure none, by design

03 System mechanics & technical rigor

Specified like infrastructure, stated so it can be tested.

For CTOs and technical evaluators

Data ownership Sovereign Complete sovereignty. Databases synchronize with client-controlled infrastructure.	Reliability Offline-capable Operational nodes designed to function without internet disruption.
Latency < 100 ms Sub-100ms internal state changes across multi-terminal setups.	Integrations Deterministic Clean, deterministic APIs connecting legacy ERPs, payment gateways, and third-party logistics.

04 Security & compliance

Stated plainly, so it can be checked.

Properties of the systems we build, written as specifications rather than assurances.

	
<i>We do not claim certifications on this page. If you must meet a specific regulation, we design to it and show you how.</i>	
	☒ Data location Client-controlled infrastructure. ☒ Access Role-based. Permissions are explicit and reviewable. ☒ History An append-only record of changes and actions. ☒ Agents Bounded permissions, approval gates, a full action log, and every action reversible. ☒ Network Outbound access denied by default. ☒ Failure Offline-capable nodes and deterministic recovery.

05 How we work

Four stages. One owner at each.

Every engagement follows the same order, so you always know what is being decided and what comes next.

01 Understand We map how work actually moves through your business: systems, hand-offs, waiting and re-entry. You receive A written map of current operations, and the baseline for the 30% target.	02 Design We specify the system: data model, integrations, failure behavior, and what must run offline. You receive An architecture document you can hand to your own engineers.	03 Build We build and test in your environment, in stages, each one usable on its own. You receive Working software, tested against the baseline.	04 Operate We run it with you, monitor it, and hand over ownership when you are ready. You receive Runbooks, access, and the option to run it yourselves.
--	---	--	--

06 Engagement models

Two ways to start.

	Pillar A Turnkey modules	Pillar B Bespoke systems
Best when	Your process matches a standard shape: stock, units, a sales ledger.	Your operations are particular to you and no product fits.
What we do	Configure, connect and deploy a tested module.	Specify and engineer from scratch.
From you	Access to current systems, a named process owner, and your configuration decisions.	Time with the people who run the work, access to systems and data, and a named decision-maker.
You get	A running system, and training.	A system built to your flow, with full documentation.
Start with	The technical dossier.	An architectural walkthrough.

07 Questions from engineers

Plain answers to the usual questions.

Longer answers, with diagrams, are in the technical dossier.

Ask us directly →

Who owns the data?	—
You do. Databases synchronize with infrastructure you control, and we keep no copy that we depend on.	
What happens without internet?	+
How do we migrate from our current system?	+
Can it connect to our ERP and payment gateway?	+
Do agents send our data to outside services?	+
What if we outgrow a turnkey module?	+

08

The Sanad manifesto

Software should clarify the mind, not demand it.

Most enterprise software creates its own bureaucracy. Teams spend hours managing the tool that was supposed to save them time. Sanad is built on the inverse thesis: intelligent software works silently in the background so leaders and builders can dedicate their focus to what actually matters.

Support for the people who lead.

If the work is heavier than it should be, we should talk.
