

Enterprise engineering studio · Intelligent software for modern commerce

Intelligent systems built to quietly run commerce.

Sanad constructs operational backbones and bespoke autonomous logic for commercial enterprises. We remove the cognitive and administrative weight of scaling — engineering a structural reduction of at least 30% in daily operational load.

[Request Technical Dossier](#) →

[Read the 30% baseline](#)

For Leadership

Predictable velocity, margin protection, and operational clarity.

For Engineering

Decoupled architecture, local-first integrity, and zero black-box dependencies.

The 30% efficiency baseline

Eighteen hours of lag becomes sub-second. Repeated reconciliations become zero-loss. Data re-keyed in every system is eliminated.

01 Proof by metric

≥ 30%

of daily operational load, structurally removed.

Every system we build is specified against one baseline: a structural reduction of at least 30% in daily operational load.

02 Systems & architecture

Ready-made modules. Bespoke engineering.

Two explicit offerings, never blended. Pillar A is production-tested software, configured for your business. Pillar B is engineered from scratch, for operational flows that belong to you alone.

A Turnkey Intelligent Modules Choose what you run.

[Request this configuration](#) →

☒

Inventory

Stock position per node, reservations and transfers.

One stock position.

☐

Units

Units, stays, availability and turnover tasks.

No two stays overlap.

☒

Ledger

The transaction ledger: every entry, posted once.

Debit equals credit.

Bespoke systems · Pillar B

B Tailored Commercial Architecture

From-scratch systems, engineered for unique, proprietary operational flows.

B.1

Custom internal operating systems

Replacing patchwork spreadsheets

One system of record in place of a folder of spreadsheets: role-based views, enforced workflows, and a history of every change.

record

single source of truth

access

role-based

history

append-only

B.2

Private agentic workflows

Operating securely on client infrastructure

Autonomous logic that runs inside your perimeter, on your hardware or your cloud account. Every action is logged, bounded by explicit permissions, and reversible.

runtime

client infrastructure

egress

denied by default

oversight

approval gates, full action log

B.3

High-availability distributed databases

With offline-first synchronization

Replicated stores that keep accepting writes when the network does not, then converge deterministically when it returns.

writes

local-first

merge

deterministic

single point of failure

none, by design

03 System mechanics & technical rigor

Specified like infrastructure, stated so it can be tested.

For CTOs and technical evaluators

Data ownership

Sovereign

Complete sovereignty. Databases synchronize with client-controlled infrastructure.

Reliability

Offline-capable

Operational nodes designed to function without internet disruption.

Latency

< 100 ms

Sub-100ms internal state changes across multi-terminal setups.

Integrations

Deterministic

Clean, deterministic APIs connecting legacy ERPs, payment gateways, and third-party logistics.

04 Security & compliance

Stated plainly, so it can be checked.

Properties of the systems we build, written as specifications rather than assurances.

We do not claim certifications on this page. If you must meet a specific regulation, we design to it and show you how.

- ☒ **Data location**
Client-controlled infrastructure.
- ☒ **Access**
Role-based. Permissions are explicit and reviewable.
- ☒ **History**
An append-only record of changes and actions.
- ☒ **Agents**
Bounded permissions, approval gates, a full action log, and every action reversible.
- ☒ **Network**
Outbound access denied by default.
- ☒ **Failure**
Offline-capable nodes and deterministic recovery.

05 How we work

Four stages. One owner at each.

Every engagement follows the same order, so you always know what is being decided and what comes next.

- 01 Understand

We map how work actually moves through your business: systems, hand-offs, waiting and re-entry.

You receive

A written map of current operations, and the baseline for the 30% target.
- 02 Design

We specify the system: data model, integrations, failure behavior, and what must run offline.

You receive

An architecture document you can hand to your own engineers.
- 03 Build

We build and test in your environment, in stages, each one usable on its own.

You receive

Working software, tested against the baseline.
- 04 Operate

We run it with you, monitor it, and hand over ownership when you are ready.

You receive

Runbooks, access, and the option to run it yourselves.

06 Engagement models

Two ways to start.

Best when	Turnkey modules
	Your process matches a standard shape: stock, units, a sales ledger.
Bespoke systems	Your operations are particular to you and no product fits.
What we do	Turnkey modules
	Configure, connect and deploy a tested module.
Bespoke systems	Specify and engineer from scratch.
From you	Turnkey modules
	Access to current systems, a named process owner, and your configuration decisions.
Bespoke systems	Time with the people who run the work, access to systems and data, and a named decision-maker.
You get	Turnkey modules
	A running system, and training.
Bespoke systems	A system built to your flow, with full documentation.
Start with	Turnkey modules
	The technical dossier.
Bespoke systems	An architectural walkthrough.

07 Questions from engineers

Plain answers to the usual questions.

Longer answers, with diagrams, are in the technical dossier.

[Ask us directly](#) →

Who owns the data?

You do. Databases synchronize with infrastructure you control, and we keep no copy that we depend on.

What happens without internet? +

How do we migrate from our current system? +

Can it connect to our ERP and payment gateway? +

Do agents send our data to outside services? +

What if we outgrow a turnkey module? +

08

The Sanad manifesto

Software should clarify the mind, not demand it.

Most enterprise software creates its own bureaucracy. Teams spend hours managing the tool that was supposed to save them time. Sanad is built on the inverse thesis: intelligent software works silently in the background so leaders and builders can dedicate their focus to what actually matters.

Support for the people who lead.

If the work is heavier than it should be, we should talk.
